

Succulent Easy-Care Guide

Congratulations on your new succulent! Follow these simple tips to keep your plant healthy and thriving.

1. light requirements

bright, indirect light: Place your succulent in a location with at least 6 hours of bright, indirect sunlight daily. Avoid direct sunlight to prevent leaf scorch.

2. watering

water sparingly: Allow the soil to dry out completely between waterings. Check the soil by sticking your finger an inch deep; if it's dry, it's time to water thoroughly, allowing excess water to drain.

3. repotting

when to repot: If your succulent outgrows its pot or the soil becomes compacted, repot it in a slightly larger container with fresh, well-draining soil.

4. enjoy your succulent!

personal touch: Feel free to decorate with pebbles or stones, but ensure they don't block drainage holes. Enjoy the beauty and growth of your succulent!

Additional Care Tips:

soil: use a cactus or succulent potting mix for optimal drainage.

temperature: keep your plant in temperatures between 60°F and 80°F (15°C to 27°C) and protect it from frost.

fertilizing: during spring and summer, fertilize once a month with diluted balanced fertilizer. Skip fertilizing in fall and winter.

pest control: monitor for pests like mealybugs and aphids and maintain good airflow around your plants.

Thank you for choosing our products!

We hope they bring joy and beauty to your space.
